

Throw Back to Basics

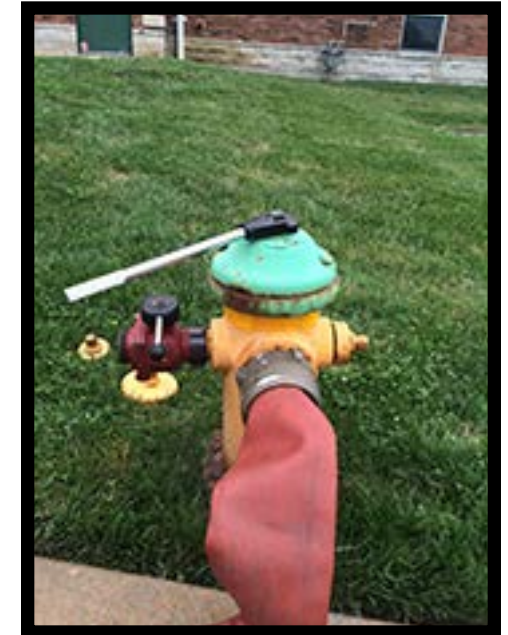

Catching the Hydrant

Wrap the hydrant with enough hose to make the connection and allow for the apparatus to deploy line for the lay

Remove steamer and side cap, attach ball valve and flush hydrant, this may seem time consuming and useless but debris in the pump or nozzle equates to failure on the fire ground, the ball valve allows for additional units to supply off the hydrant if needed

Connect LDH and await call for water, after charging the line walk line up to fire ground to ensure no kinks and tight connections
